

AI Usage and Verification Process

AI tools were used as research assistants during this assignment.

Tools Used

- ChatGPT
 - Claude
 - Gemini
 - LinkedIn search
 - Web search tools
-

How AI Was Used

AI was primarily used for:

- structuring research workflows,
- organizing findings,
- generating research frameworks,
- summarizing company information,
- and improving documentation quality.

AI was NOT used for blind copy-paste submissions.

Manual Verification

All shortlisted companies were manually reviewed using:

- company websites,
- LinkedIn,
- news articles,
- and public business databases.

Scores were manually adjusted wherever AI-generated outputs appeared unrealistic or overly optimistic.

Human Judgment Applied

The following areas required manual evaluation:

- operational maturity,
- differentiation quality,
- leadership involvement,

- growth credibility,
- and systems evidence.

Rejected companies were also manually documented with reasoning instead of automatic filtering.

Assignment Philosophy

The objective was to use AI as a thinking and productivity tool while still applying independent judgment, verification, and structured reasoning throughout the assignment.
